Morning program

Managing Aesthetic Failures on Anterior Dental Implants: Etiologies & Treatment Solutions

Dr. Stephen Chu

Synopsis

Aesthetic failures associated with dental implants in the aesthetic zone can be one of the greatest challenges facing the dental team. These dilemmas can present themselves as either mid-facial, interdental, or combination defect types. A significant part of treatment therapy revolves around correction of these aesthetic defects due to either poor treatment planning, implant placement, or restorative contours. Surgical, orthodontics, and restorative treatment planning options and techniques to address these aesthetic deficiencies will be presented in a sequential manner from simple periodontal-restorative solutions to more complex case types involving orthodontics, periodontics, and prosthetics.

Learning Outcomes

After this presentation, the attendee should be able to:

- * Know the potential of hard and soft tissue correction around aesthetically challenged anterior implants
- * Know when adjunctive orthodontic therapy should be employed
- * Know when a prosthetic restorative solution is the best treatment plan option
